

WHAT DENTISTS ARE SAYING ABOUT CALAJECT™

Dentist Jan Frydensberg Thomsen, DK

"I was first introduced to computer assisted local anesthesia in 2007 - and have been using such a device ever since. Computer controlled injection has an incomparable ergonomic advantage over manual injection, as you do not need to bend your wrist and press the plunger simultaneously. I can sit relaxed and inject. I have a greater success rate with nerve blocks - and the low computer controlled injection rate makes it virtually pain free for the patient. Now I have been using CALAJECT for a while. It has given me some extra benefits; the hand piece is heavier, and after getting accustomed to that, it has become advantageous - it is well balanced and easy to control."

Dentist Anders Boel, DK

"I provide more patient friendly injections today, than I did when I injected manually. In nine cases out of ten I only need to do intraligamental injection or infiltration, which means less analgetic solution per patient. From the pressure control I receive a very good feedback, that tells me if I have placed the needle right - that the solution is not just leaking back."

Dentist Lisbeth Skibsted, DK

"I want to deliver as local an injection as possible so my patients can leave the clinic without a numb cheek, tongue and lip - and without soreness in the soft tissue later on. CALAJECT meets this demand. In addition, I appreciate that CALAJECT is an cost effective device - no other cost than my usual cartridges and needles incur."

WHAT DENTISTS ARE SAYING ABOUT CALAJECT™

Dentist Søren Holm, DK

"CALAJECT makes it easier for me to treat my nervous patients. They are calm in the chair – and really enthusiastic about the fact that I can provide anaesthesia without any discomfort."

Dentist Mette Kæraa, DK

"CALAJECT can create life-long and loyal patients due to its painfree injections. It has become an indispensable element of the pain-free dental treatment that we offer."

Dentist Ralf Breier, DE

"Electronically controlled anesthesia is an indispensable part of our daily practice. When you ask our patients, and we ask after each anesthesia, the unanimous opinion is that this is a landmark. We sit relaxed by the patient, can support us comfortably, the patient does not jerk and asks after the injection, if we did anything. This positive experience excites dentist and patient - and believe me, the patient tells it on."

Dentist Rune Ørum Luk, DK

"It puts out a clear signal that the clinic is using the latest technology. In other words, we are investing in our patients' well-being."

WHAT DENTISTS ARE SAYING ABOUT CALAJECT™

Dentist Tina Løbner, DK

“CALAJECT is amazing! It has clear advantages over the device I used to work with. It allows me to do all types of local anesthetics. I avoid waste of anesthetic liquid and cost of disposable hose sets – only need the standard needles and cartridges, I use for manual anesthesia. It is also easy to clean.”

Dentist Hanna Marcinowska, PL

“I have been using computer-assisted analgesia for many years, in fact ever since it appeared on the market. It has improved the comfort of administering anesthetics incredibly - for both patients and for me. I can no longer imagine analgesia using a carpoule syringe, neither can my patients. Unfortunately, until recently, a major problem for computer-assisted analgesia was the high costs of a single anesthetic. That is why it immediately drew my attention, when the latest system CALAJECT appeared, which does not require special, dedicated expensive parts. CALAJECT is extremely easy and intuitive, and for analgesia I now use needles and cartridges like for a carpoule syringe. CALAJECT is very modern, I liked its design and special programs for different types of analgesia. In practice, the system that controls tissue resistance is also very useful - the device turns off automatically when tissue resistance is too high. Thanks to this, I am certain that the patient won't feel expanding and pain.”

WHAT DENTISTS ARE SAYING ABOUT CALAJECT™

Dentist Marcin Bogurski, PL

“I’m a second-generation dentist and I have been observing the development of my profession since childhood. Over the last 40 years, the changes have been enormous and we all know it. The approach to patients feeling pain during dental treatments has also changed. Analgesia is simply a standard procedure for all practitioners. However, the expectations from patients are growing and they demand that analgesia itself takes place painlessly. I tested many devices of this type in my practice over several years, but I remained faithful to my experience with the reliable carpoule. But everything changed when I got to know the CALAJECT device. Today, the aesthetic and modern, small device is my faithful companion during long working hours. And the patients ... well, they are delighted.”

Dentist Stephen Selwyn, UK

“I have to say that right from my very first use I have been as impressed as my patients. The learning curve was very short (almost none) and patients have not been able to feel anything on many of the injections and hardly anything on the others. So far I have not had a single patient have a bad experience, all have been successfully anaesthetised and it also seem to me that they are numb quicker although this may be due to the injection taking longer. I also really like the safety-sheathing for protection against needle stick injury and do not find it any barrier to use.”
